

INTRODUCTION OF SENSE ORGANS

(16.4.18-20.4.18)

Children are wired to receive and utilize sensory input: they see, smell, taste, hear and feel. The senses are their most familiar and basic way to explore, process and come to understand new information.

How do different materials feel? Are they smooth, wet, dry or rough?

How do different materials taste? Do they taste sweet, salty, sour or bitter?

Learners of D.A.V. answer these questions and many more through fun activities using their Sensory-motor Skills. These activities allow them to gain insight and information by providing essential hands-on experiences.
